

Date 2002

Location Nicholas Tower Project, Trinidad

Main Contractor Carillion Caribbean

Carillion Caribbean in Trinidad undertook detailed monitoring of some materials consumed over the past two years. This monitoring is alongside other environmental initiatives including waste management

Environmental initiatives on site in Trinidad

Business Benefits

- **Example of innovative sustainable ideas on site**
- **Cost effective solution - giving resources / materials more than one life, a sustainable solution**

An excellent example of waste utilization is demonstrated on the Nicholas Tower Project site in Trinidad. Excess concrete which was previously used on site to either fill in areas e.g. material storage area or allowed to harden then disposed via skips, is now converted into 50 kg concrete

blocks used for load testing the hoists. Previously bags of cement were used to load test the hoist which could have possibly been damaged during the loading and unloading process resulting in a cost to the site.
